

- **How is your team doing? Does it work well? Can you improve?**

We are doing well! This sprint we got much of the base structure in place and made good progress overall. No problems encountered.

- **How do you ensure that your software is of good quality? Any measures you have taken (e.g., pair programming, test procedures, code reviews etc?)**

As for last week we used pair programming. Also, during our sprint review meeting we displayed what had been done during the week and everybody got a chance to ask questions to clarify things. We also carried out our merging during the sprint review meeting to enable input from everyone in case of merge conflicts.

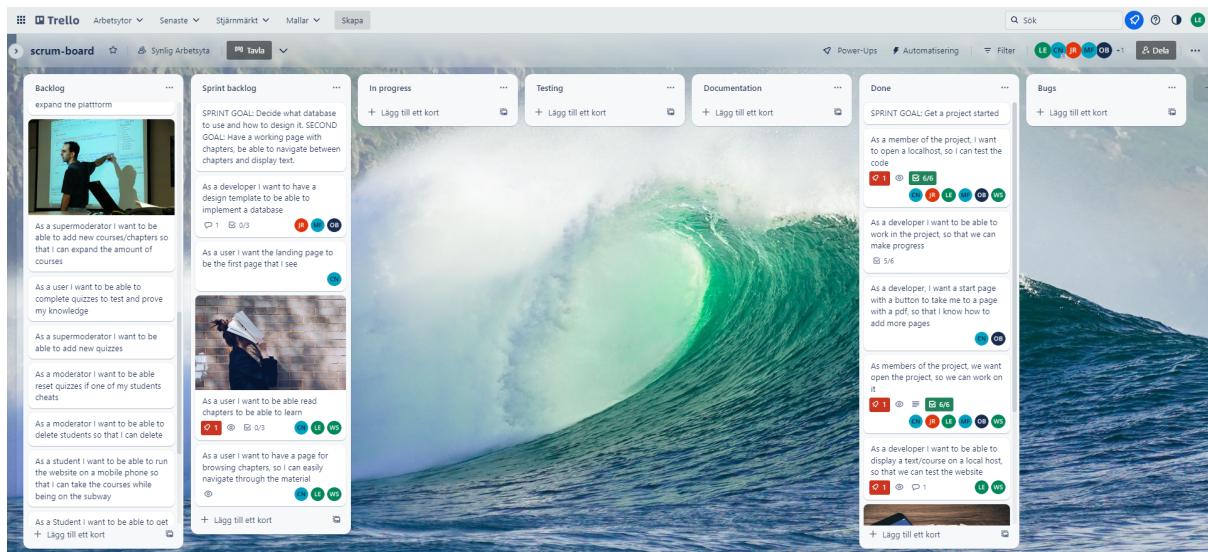

- **What user stories did you implement in this sprint?**

Our sprint goals this week revolved around the implementation of a user authentication database, research and design of a database and the implementation of the main structure of the chapters.

- **What are your plans for the upcoming sprint?**

Our plans for the upcoming sprint is to continue designing and building the database. Our focus will be on the part of the database involving the chapters as it was hard to implement this sprint when the chapters were not in place. Furthermore we will start designing the user interface of the homepage where the user can see all the chapters. We will also implement the last login functionality.
